Assessment dimensions

Conceptual Understanding —
0.0/5

Can explain what AI agents are and
how they work.

Prompting Skill — 0.0/5

Writes clear, specific, well-
constrained prompts.

 CK · Novice · Today's focus: Prompting Skill

Hi CK — I'm SAGE, your AI literacy tutor. Ready to start?

Give me an overview on what AI literacy means, and
what I should focus on to improve my AI usage

Great question, CK! AI literacy boils down to five
things:

1. **Understanding** what AI actually is (and isn't)
2. **Prompting** — talking to AI in a way that gets useful
results
3. **Evaluating output** — spotting when AI gets things
wrong
4. **Ethical awareness** — knowing when AI use is
appropriate
5. **Critical thinking** — understanding AI's limits

The good news: you build all of these through practice,
not memorizing theory. And today's focus is on
prompting — because better prompts = better results
from any AI tool.

Before we dive in, quick question: **What's ONE thing
you've tried (or want to try) using AI for?** That'll help
me pick the right practice for you.

I want to use AI to improve automation workflow

Nice — automation workflows are a great use case for
AI. That tells me you're thinking practically, which is a
solid starting point.

Here's what we can do today — pick one, or tell me something else:

1. **Improve a recent AI interaction** — paste a prompt or conversation you had
2. **Practice with a scenario** — try writing prompts, evaluating AI output, or designing a workflow
3. **Reflect on your recent AI use** — what worked, what you'd change

Which sounds good? (Just pick a number!)

demo two different prompts

Sure! Here are two prompts for the same task — automating a weekly report:

Prompt A:

"Help me automate my weekly report."

Prompt B:

"I'm a project manager who sends a weekly status report every Monday. The report includes task completion %, blockers, and next week's priorities. Write a step-by-step workflow for automating this report using AI, including where a human should review before sending."

Quick question before I break it down: **Which prompt do you think would get a more useful response — A or B — and why?** (Even a one-word answer is fine!)

b

Exactly right — B wins every time. 👍

Why do you think B works better? Pick whichever fits:

(a) It's longer (b) It gives the AI more specific details to work with (c) It sounds more professional (d) Not sure

b

Spot on, CK! Specific details give the AI something concrete to work with instead of guessing what you mean.

Prompt B actually follows a simple framework called **CRAFT**:

- Context — "weekly status report every Monday"
- Role — "I'm a project manager"
- Action — "write a step-by-step workflow"
- Format — "step-by-step"
- Tone — professional (implied)

Think of it like giving directions — "go to the store" vs. "drive north on Main St. to the grocery store on the corner." More detail = less guessing.

Want to try writing your own prompt using CRAFT? I can give you a practice scenario based on automation workflows. (yes/no?)

critique my own prompt writing from this conversation

Love that instinct — looking at your own work is the fastest way to improve! Let's look at two things you typed to me:

Your Prompt 1:

"Give me an overview on what AI literacy means, and what I should focus on to improve my AI usage"

Your Prompt 2:

"demo two different prompts"

Before I give my take — **which of those two do you think is stronger, and what makes it better?** (Just pick 1 or 2 and a quick reason!)

1, better instructions

Exactly right! Prompt 1 tells me **what** you want (an overview) and **why** (to improve your AI usage). That's solid.

Prompt 2 — "demo two different prompts" — worked okay here, but imagine sending that to ChatGPT. It'd have no idea *what kind* of prompts, *for what task*, or *what format* you want.

Now here's the fun part — **look at Prompt 1 through the CRAFT lens. Which of the five elements (Context, Role, Action, Format, Tone) is it missing?** Pick any that apply!
